Project Statement (200 words)	This project is meant to explore patterns in reported crimes across a few major U.S. cities by combining crime incident reports with socioeconomic data from the U.S. Census Bureau. This crime data will be collected from city databases for San Francisco, Los Angeles, San Diego. For the sake of data consistency, this analysis will primarily cover the period from 2018 to present day. By standardizing and comparing broad crime categories like violent, automobile, property crimes, and crimes against society, we can create a comparison between all the cities. Beyond the city to city comparisons, the project will use geographic coordinates, county boundaries, and district boundaries whenever possible. Such dashboards will also be connected to census information for even more analytical power. With the census, we can track socioeconomic variables such as poverty rate, unemployment, educational attainment, population density, age, etc. Demographics characteristics such as race and ethnicity will intentionally not be used. Instead, the project will focus on socioeconomic and geographic conditions that may help reveal broader structural patterns associated with reported crime.		
Objectives and/or steps toward project completion)	- Collect/standardize city-level crime data - Clean and merge crime datasets - Classify crimes based on broad categories - Combine crime data with census data - Analyze relationships between socioeconomic factors and crime - Compare patterns between different cities - Identify trends over time - Visualize results with dashboards, charts, etc. - Build and test website - Work on final report - Create video/presentation - …. (subject to change as things get added)		

Weekly Schedule and individual assignments	We plan to meet 1-2 times per week. …… The individual assignments are…. Weekly Schedule: ● 9/27-10/3: Find multiple datasets (split among members) and report back in a meeting to go over discoveries we each found. ● 10/4-10/10: Once the team agrees on the datasets and features to be used, we will merge and clean the data with the intent of having a comprehensive dataset. ● 10/11/-10/17: Explore the comprehensive dataset to find any trends, anomalies, outliers, etc. ● 10/18-10/24: Have a discussion about the types of visualizations to be used (dashboards, charts, graphs, etc) and how we want the website to look. ● 10/25-10/31: Begin working on the prototype of our website. ● 11/01-11/7: Refine visualizations, make the website more visually appealing, and ensure long term sustainability of our website through testing and debugging. ● 11/08-11/14: Continue analyzing the data and finalizing the features of our website. ● 11/15-11/21: Work on the final report and continue testing the site. ● 11/22-11/28: Thanksgiving break ● 11/29-12/05: Begin wrapping up the report and begin creating the video. ● 12/06-12/12: Finish editing the video and begin preparing for the in person presentation. Individual Assignments: ● Matthew: Data collection. Aiding in cleaning and processing of crime/census data. Helping with statistical/trend analysis visualizations. ● Christian: Cleaning + processing dataset, help build both the frontend and backend of the website, testing website (unit tests, integration tests, UI tests, etc). ● Sam: GIS analysis and visualization, collecting census data, video editing ● Renton: Data cleaning and merging, visualizations, final report
